

Optimum pressure for all load ranges – with Coolant Expansion Tanks from febi bilstein

In the cooling circuit of motor vehicles, the expansion tank ensures the required system pressure and offsets coolant fluctuations. Thus, it has a decisive function: In an emergency, the overpressure valve in the tank cover prevents parts of the cooling circuit from being damaged or bursting due to excessive pressure.

Coolant expansion tanks from febi bilstein meet all OE material specifications and guarantee easy installation, thanks to the exact dimensions. Time-consuming re-ordering and installation of accessories is not required as the coolant expansion tank from febi bilstein is provided with covers and coolant level sensor.

Advantages at a glance:

- Cover with integrated overpressure valve prevents damage due to excessive pressure in the cooling system
- Support sleeves in the hose connections prevent deformation and thus prevent leakage
- Coolant expansion tanks and coolant level sensors are also available separately for cost-effective repair

e.g. febi no. 49685

to fit:
IVECO EUROSTAR, EUROTECH, EUROTRAKKER
Repl. no. 0 0816 8290 S1

febi no. 49673

febi no. 49684
