## Bringing Light into Darkness

If commercial vehicles or machines are operated in the dark, good visibility is extremely important. If stationary light sources are missing in the working area, the necessary illumination can only be ensured with additional work lights on the vehicle. Modern, efficient LED technology enables them to achieve good luminous efficacy with comparatively low power consumption.

The professional installation of febi worklights is simple and uncomplicated thanks to the accessories supplied. With the crimp connectors enclosed, the connection cable can be professionally connected to the wiring on the vehicle side. The shrink tubing, which is also included, reliably protects the connection point.

When installing worklights, please observe the applicable statutory regulations and the guidelines of the vehicle manufacturer.
